## Table of contents

Create a new Quarto document where you set the title, date, and the author explicitly. Write a sample text that comprises...

- ...at least one level 1 heading
- ...at least two level 2 headings
- ...a YAML part that specifies that R code remains hidden by default
- ...one R chunk where both the output and the code is printed in the final document
- ...one R chunk that produces a simply ggplot object and where the code producing the plot is hidden

Then do the following:

1. Knit the document to `html` with a floating table of contents and a [special theme](#).
2. Make the document available via [Netlify Drop](#) and add the possibility to download the underlying Rmd file. *Note: For Netlify Drop to work, the html file must be called `index.html`!*
3. Knit the document to PDF and make sure that it includes a table of contents.

A sample solution for the Rmd file can be found [here](#) (the Netlify version is [here](#)).
